GREENPOINT TOKEN

$WEEDSEED

WHITE PAPER

Version 4.0 • June 2026

A Revenue-Backed, Yield-Bearing Token

Paid in USDC on Solana

CONTRACT ADDRESS

EnYJU3UV7buAZV8SimWtKG4UwfJVZZwhHxhzCB2411G5

1. Executive Summary

Greenpoint represents a paradigm shift in small-business capitalization. We are moving beyond the illiquidity of traditional private equity and the empty speculation of utility tokens.

$WEEDSEED is a Revenue-Backed, Yield-Bearing Token. It creates a digital bridge between the real-world profits of the Greenpoint Operating Company and the liquidity of the Solana blockchain.

Unlike a stock, which is held passively and trades on sentiment, $WEEDSEED is a **direct claim on the business's revenue**. Holding the token entitles you to a pro-rata share of the revenue the company sets aside for holders — paid straight to your wallet in **USDC stablecoin**. The business does not "print" tokens to pay yield, and holders are never required to sell, stake, or claim anything to receive it. A fixed share of revenue is set aside and distributed as USDC, automatically, in proportion to each holder's stake.

2. The Legal Structure (The SPV Model)

To ensure regulatory clarity and operational agility, the tokenization structure utilizes a **Special Purpose Vehicle (SPV)** framework. This separates the operational risks of the physical business from the financial rights of the token holders.

2.1 The Entities

- **The OpCo (Operating Company):** The physical business entity. It holds the leases, hires staff, carries liability insurance, and conducts daily commerce. The OpCo is not tokenized directly.
- **The SPV (Special Purpose Vehicle):** A holding entity created solely to manage the dividend pool and enforce the token contract.
- **The Relationship:** The OpCo is contractually obligated to transfer a fixed percentage of its revenue to the SPV.

2.2 What The Token Represents

The $WEEDSEED token represents a **Member Economic Interest** in the SPV.

- **Economic Rights:** Holders are entitled to their pro-rata share of the USDC dividend pool held by the SPV.
- **Governance Rights:** None. The token conveys no voting rights, management control, or operational oversight of the OpCo.
- **Asset Class:** The token is defined as a **Revenue-Participation Contract**. It is not a debt instrument and not a voting share. It is a right to variable yield based on performance.

3. The Economic Engine (The Payout Mechanism)

Greenpoint pays holders **directly in USDC**. To keep network fees negligible, distributions are batched on a short cycle rather than fired on every individual sale.

3.1 How Distributions Work

1. **Revenue Capture.** A fixed share of every sale — currently **10%** — is allocated to a dedicated **USDC dividend pool** held by the SPV. It accrues there; nothing is paid out on the sale itself.

2. **Fee-Efficient Batching.** Sending a separate USDC payment to every holder on every single order would spend a disproportionate amount on Solana transaction fees relative to the payout. Instead, the pool is distributed on a fixed **~30-minute cycle**. Batching this way keeps total network-fee overhead **below 1%** of the amount distributed — the explicit design target.

3. **Near-Real-Time in Practice.** Greenpoint averages roughly one order every 39 minutes, so a 30-minute cycle distributes at almost the same rate orders arrive. In effect, dividends go out about as fast as sales come in — without the fee penalty of per-order payments.

4. **Pro-Rata, Direct to Wallet.** Each cycle, the pool is divided across all eligible holders in proportion to their share of the circulating supply and sent as **USDC straight to their Solana wallets** — no token purchase, no swap, no claim step.

3.2 Eligibility

- Holders must hold at least **$1 worth of $WEEDSEED**, measured against the live token price at each distribution. This keeps negligible “dust” balances from fragmenting payouts and wasting fees.
- The liquidity pool and other excluded addresses do not receive distributions — only genuine holders do.

4. Tokenomics & Supply

Supply Overview

The token supply is fixed. No minting function exists, ensuring no future dilution of holder value.

Token Name	**Greenpoint**
Ticker	**$WEEDSEED**
Total Supply	**575,000,000**
Blockchain	**Solana (SPL)**
Distribution Currency	**USDC (SPL)**

Distribution Matrix

Allocation	Percentage	Notes
Public Float	**~72%**	Circulating supply held by investors.
Owner Stake	**~28%**	Retained by the Founder / OpCo.
Liquidity Pools	**~11%**	Locked in DEX pools (e.g., Raydium).

Percentages approximate due to liquidity-pool fluctuation. As of June 2026.

5. Risks & Disclaimers

- **Volatility Risk:** The market value of $WEEDSEED is subject to market forces and may fluctuate independently of business revenue.
- **Business Risk:** Distributions are funded by sales and are contingent on the business continuing to generate revenue. Periods of low or no sales produce low or no distributions.
- **Distribution Risk:** USDC distributions are paid on a fixed cycle and only to wallets meeting the minimum-holding requirement. Timing and amounts vary with sales volume and the size of the holder base.
- **Not a Security:** This white paper does not constitute a prospectus. The token acts as a programmatic rewards and revenue-sharing instrument via a private contract.
